

1800. BLAST LIGHT

The blast light is designed for illuminating a working area during sandblast cleaning operations. The lamp runs on 12-24 volts DC and provides a bright concentrated light which can be directed at the working area. It utilizes an approximately 800-lumen bright LED module to produce a concentrated light cone. The blast light attaches to the sandblast hose and does not interfere with operation of the handle. The operator does not have to hold the light in one hand in order for it to work effectively. The modern LED light runs on a 12-24 V DC battery or other 12-24 V DC source. The lamp has a hermetically sealed design and is protected against dust and abrasive material.

INSTALLATION

1. Mount the Blast Light body to blast hose with the bands (included in the supply package).
2. Secure electric cord to blast hose.
3. Connect power cable to a 12-24 volt DC source (battery or other).
