

## 1310 / 1320. MOISTURE SEPARATOR FILTER

**FILTER 1310**

**FILTER 1320**

All abrasive blasting machines are equipped on standard delivery with a highly efficient moisture separator to prevent the entry of moisture and oil from the compressor into the tank. This is especially necessary when using old compressors, or working at low temperatures or at a large distance from the compressor. The filter eliminates up to 98% of the condensate and oil from compressed air. This prevents work stoppages in connection with the removal of dampened abrasive from the tank.
